

Integrated Management Plans for Norwegian Sea Areas

By

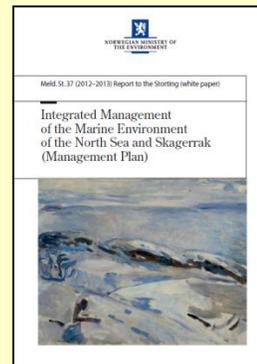

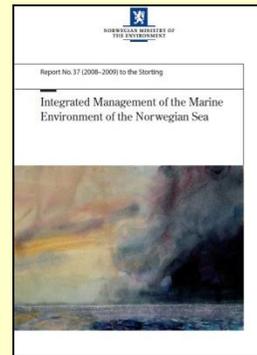

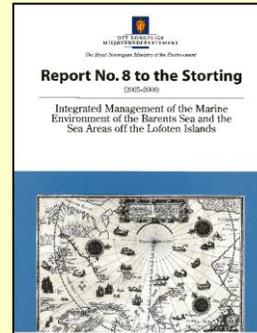

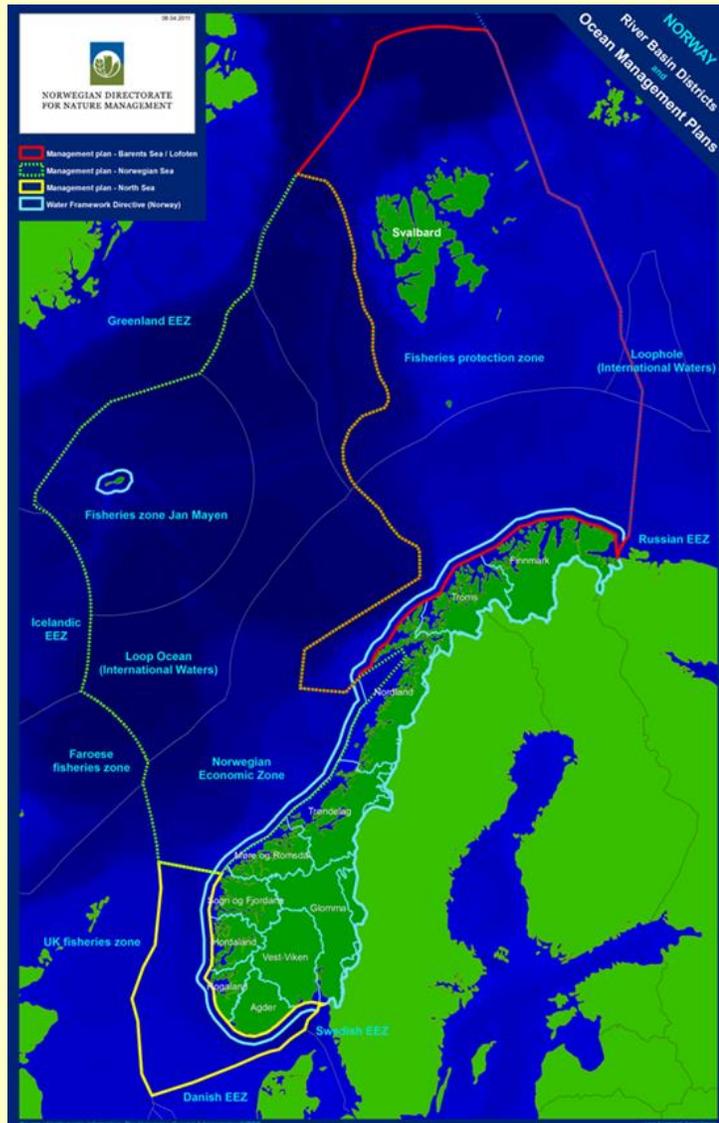

Cecilie H. von Quillfeldt

Norwegian Polar Institute

Second International Science and Policy Conference on Implementation of the Ecosystem
Approach to Management in the Arctic
Bergen, 25-27 June 2019

Background

Management plans for Norwegian Sea Areas

- Integrated Management plan for the Barents Sea and Lofoten (2006)

Updated: 2011. Revision: 2020

- Integrated Management plan for the Norwegian Sea (2009)

Updated: 2017, next update: 2020

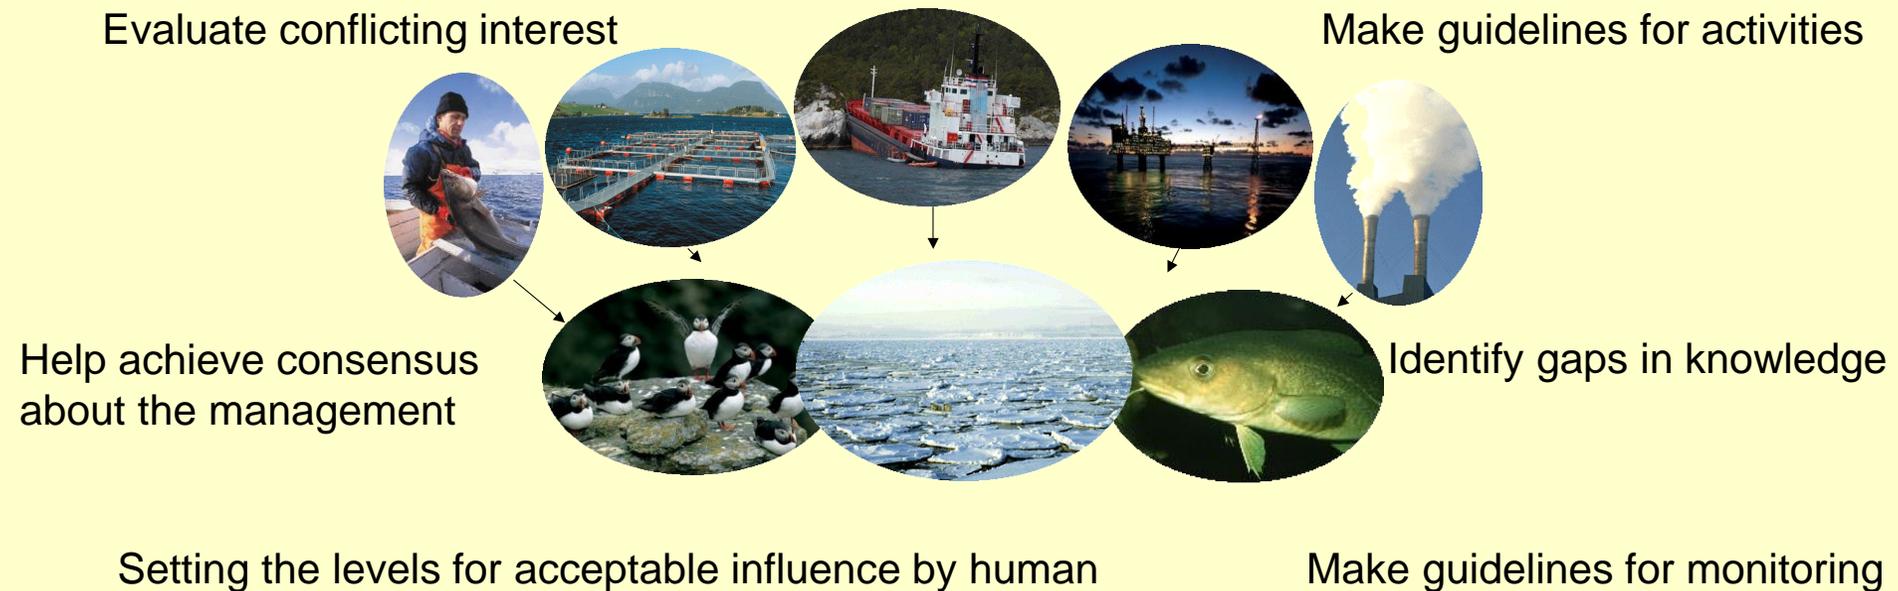

- Integrated Management plan for the North Sea – Skagerrak (2013)

First update: 2020

Need for comprehensive, ecosystem-based management

The purpose of the **Integrated Management Plans** is to provide a framework for the sustainable use of natural resources and goods derived from the area and at the same time maintain the structure, functioning and productivity of the ecosystems of the area.

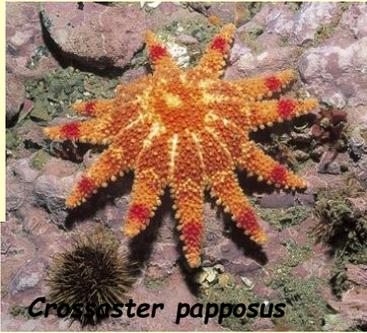

Who?

The target audience

- The management plans are intended to be instrumental in ensuring that **business interests, local, regional and central authorities, environmental organisations and other interest groups** all have a common understanding of the goals for the management of Norwegian sea areas.
- Strengthening international cooperation: share experience gained through the present management plans in the work on integrated management of the marine environment within the framework of the **OSPAR** Commission and the **EU, ICES, Arctic Council, bilateral Norwegian-Russian processes** etc.
-

What and where?

Class Asteroidea

Crossaster papposus

Class Gastropoda

Clione limacina

Class Demospongia

Haliclona sp.

Family Axinellidae

Class Scyphozoa

Haliclystus auricola

Class Malacostraca

Amphipod

Paramphithoe hystrix

Class Anthozoa

Other groups

Class Osteichthyes

Gymnelus retrodorsalis

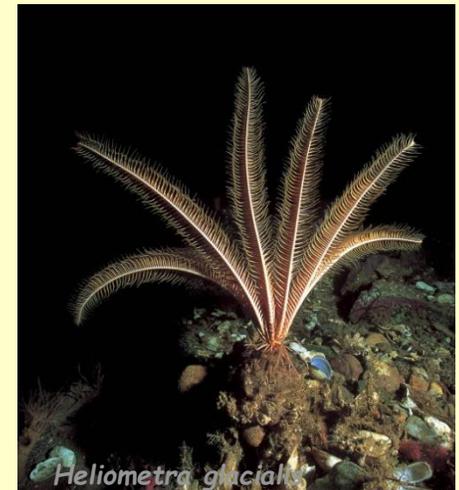

Arctic lump sucker
(*Eumicrotremus spinosus*)

Hormanthia nodosa

Class Crinoidea

Heliometra glacialis

Class Ophiuroidea

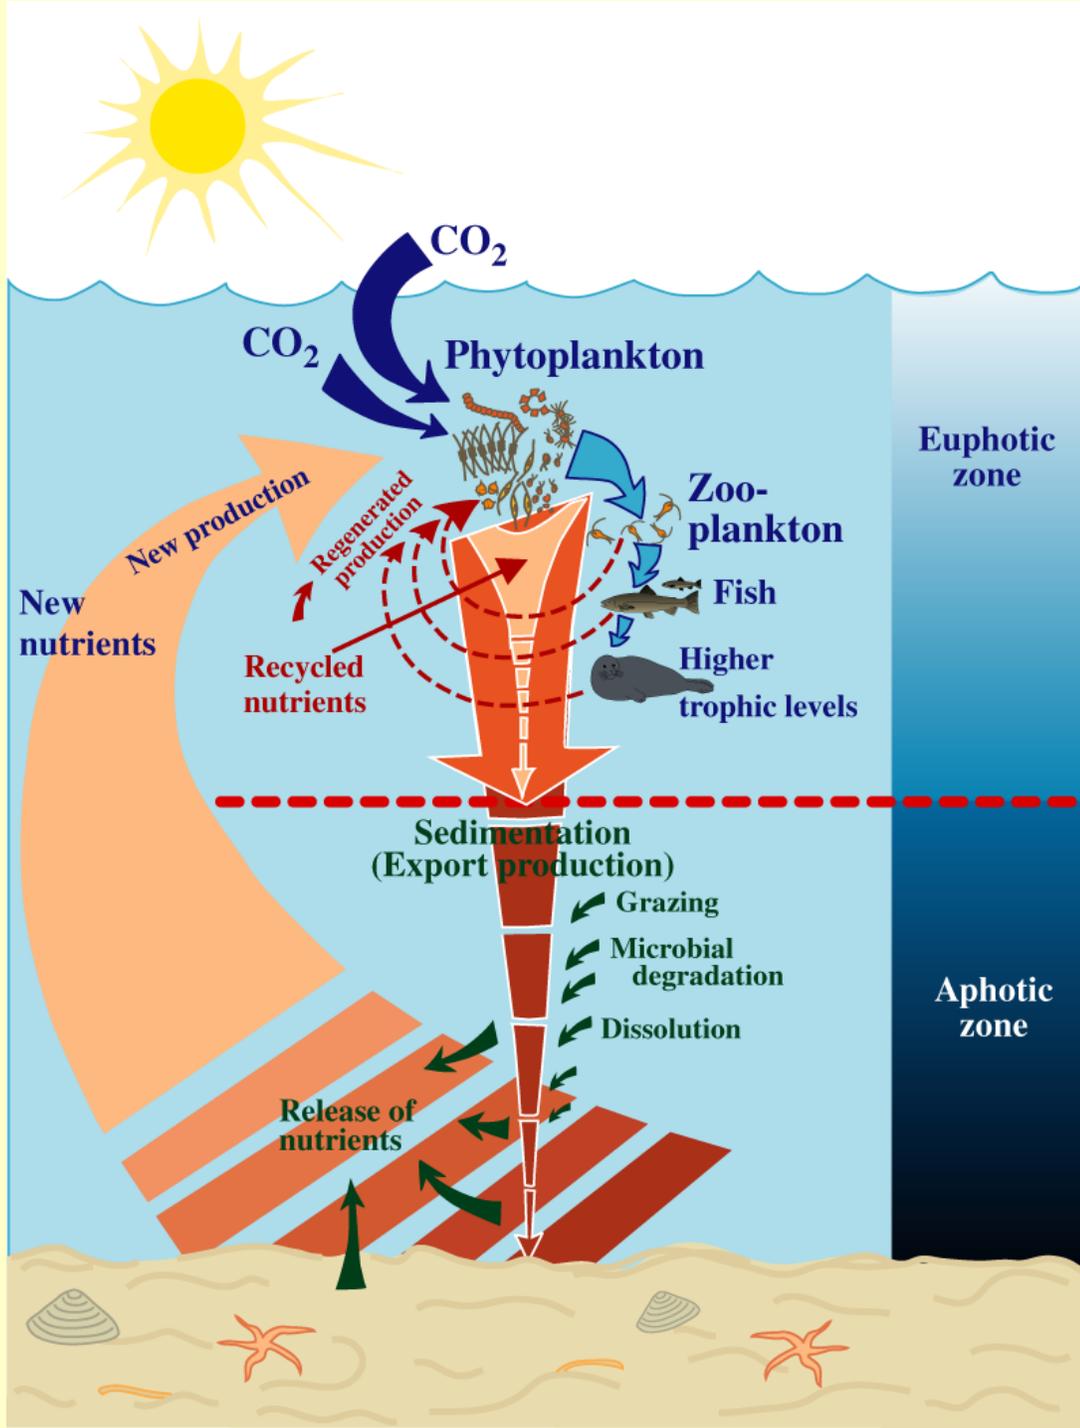

Ophiura sp., *Ophiocten* sp.

Gorgonocephalus sp.

Conceptual view on interactions and processes in Arctic marine ecosystems

(after Keck and Wassmann)

Objectives with different "functions"

Examples

- Strategic/overarching objectives
 - Overriding considerations
- High-level operational objectives/qualitative descriptors
 - Management actions
 - Specific guidelines
 - Environmental status
 - Desired state of the environment

Management of the Barents Sea–Lofoten area will ensure that diversity at ecosystem, habitat, species and genetic levels, and the productivity of ecosystems, are maintained. **Human activity** in the area will not damage the structure, functioning, productivity or dynamics of ecosystems (St. meld. nr. 8 (2005-2006)).

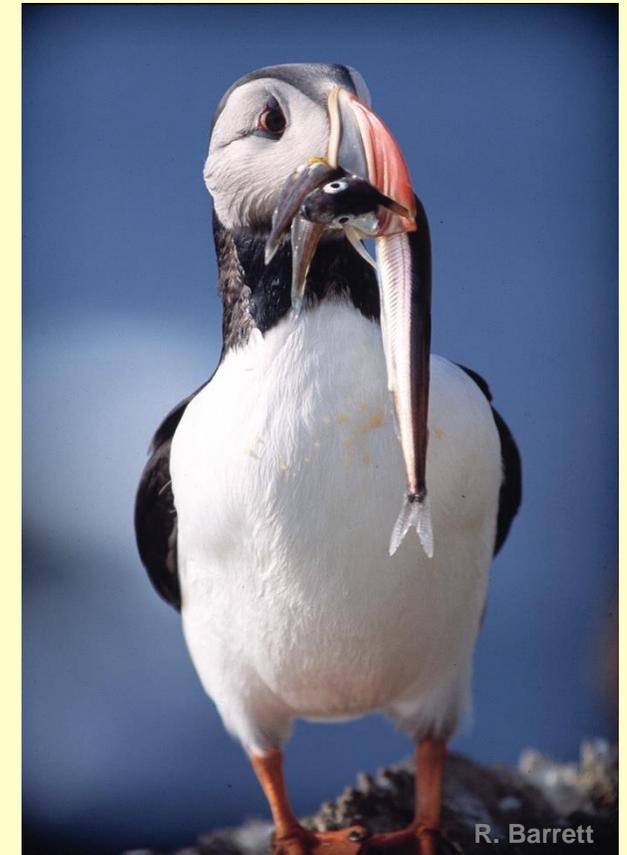

A representative **network of protected marine areas** will be established in Norwegian waters, at the latest by 2012. This will include the southern parts of the Barents Sea–Lofoten area. (St. meld. nr.8 (2005-2006)).

Harvested species will be managed within safe biological limits so that their spawning stocks have **good reproductive capacity**. (St. meld. nr.8 (2005-2006)).

Coordinated and systematic monitoring

The plan opens for an expanded and coordinated monitoring of the environment

- Monitoring system based on **indicators**, **reference values** and **thresholds for action**
- Updated knowledge about changes in the state of the environment
- Researchers and authorities can make cross-sectoral assessments and implement necessary measures to improve the environment

The Atlantic puffin (*Fratercula arctica*) may be an indicator of the availability of small pelagic fish.

Integrated Ecosystem Assessments ++

- Description of ecosystems and status of biological diversity and habitats
- Pressures and impacts on the environment
 - Description of activities
 - Climate change, ocean acidification and pollution
 - Environmental effects, incl. cumulative
- Conflicts of interest and coexistence between industries

Risk evaluation

- Models and risk analysis are being used as tools to estimate risk.
- Important to be aware of the pros, cons and limitations of these tools.
- Risk will also change over time
 - due to change in traffic volume
 - implantation of measures
 - lessons learned from accidents
 - new technology
 - etc

- Focus on different aspects of risk
 - the probability of accidental discharges
 - the probability of oil contamination
 - the risk of damage
 - the risk of damage-related costs

Particularly valuable and vulnerable areas that require special attention

The most important criteria for selecting the areas were:

- whether it supports **high production** and **high concentration** of species
- whether it includes a large proportion of **endangered** or **vulnerable** habitats
- whether it is a **key area** for species for which Norway has a special responsibility or for endangered or vulnerable species
- whether it supports **internationally** or **nationally** important populations of certain species all year round or at specific times of the year

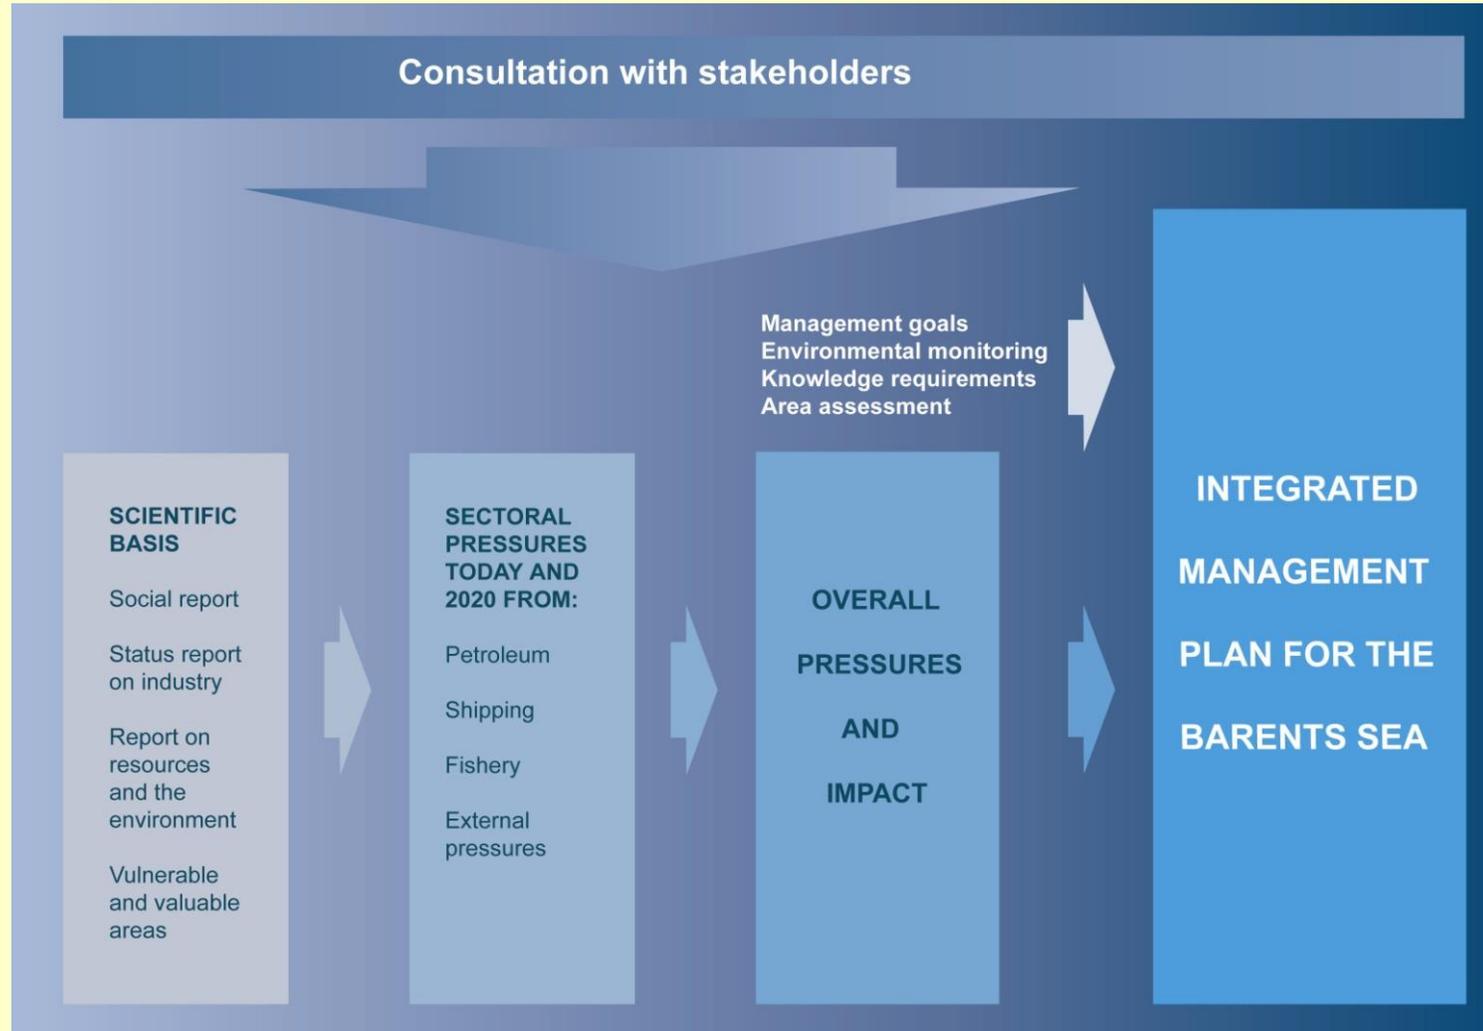

Marine ecosystem services

Group	Marine ecosystem services
<i>Production services</i>	<ul style="list-style-type: none">Production /supply of food suitable for consumptionProduction / supply of non-edible productsSupply of genetic resourcesSupply of marine resources for pharmaceutical, chemical and biotechnological industrySupply of decorative resourcesSupply of energySupply of space and waterways
<i>Cultural services</i>	<ul style="list-style-type: none">Recreational servicesAesthetic servicesContribution to science and educationMaintenance of cultural heritageInspiration for art and commercialsLegacy of the seas (value of existence/heritage)
<i>Regulating services</i>	<ul style="list-style-type: none">Climatic and atmospheric regulationSediment retentionReduction of eutrophicationBiologic regulationRegulation of hazardous chemicals
<i>Supporting services</i>	<ul style="list-style-type: none">Maintenance of biogeochemical cyclesPrimary productionMaintenance of food web dynamicsMaintenance of biodiversityMaintenance of habitatsMaintenance of ecologic resistance to change (resilience)

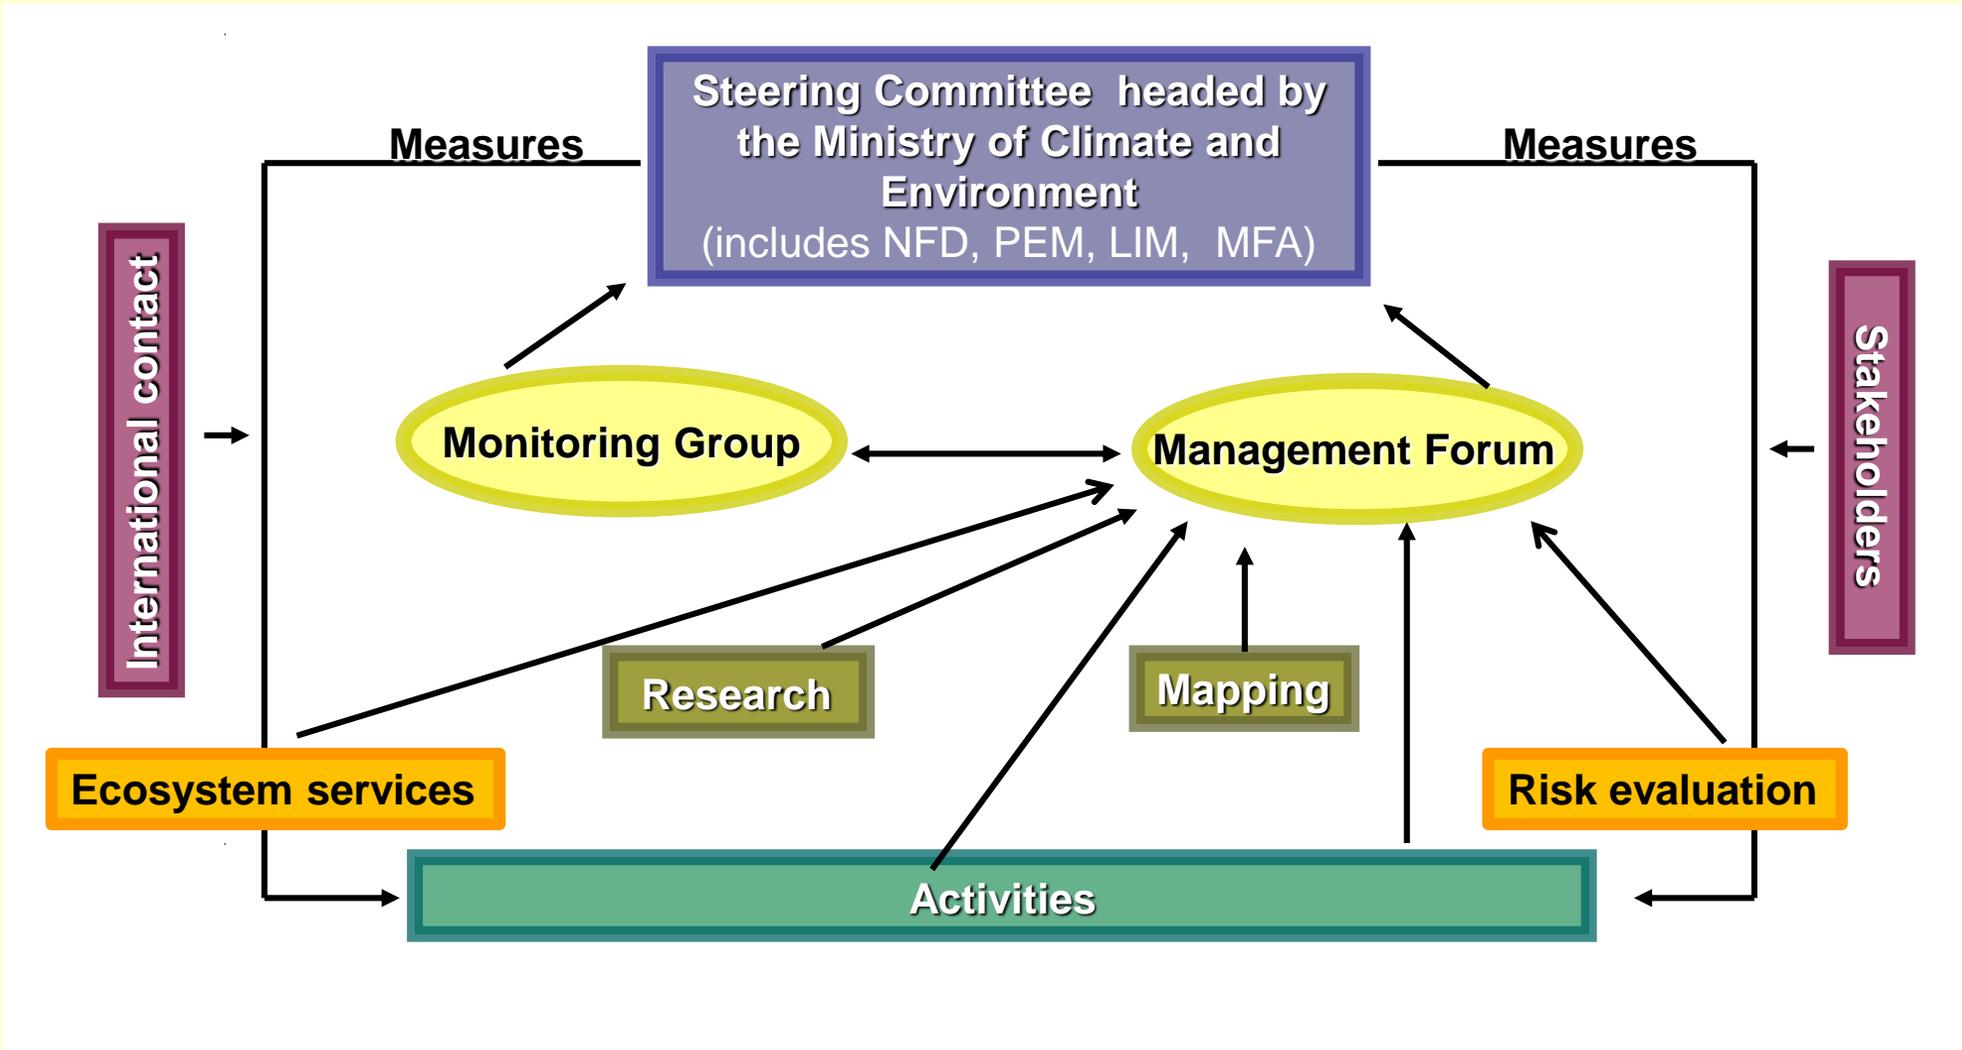

How?

The different steps of the Integrated Management Process

The elements of the system for implementing the management plan

The different groups have a broad membership, with representatives from the relevant public institutions with responsibility for and expertise in the various sectors, but will also draw on expertise from other sources as necessary.

Integrated Management Plan implementation

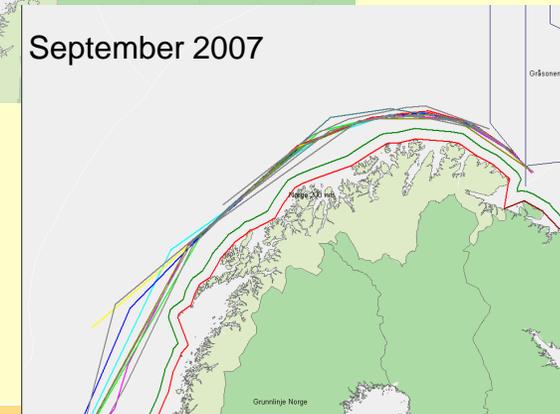

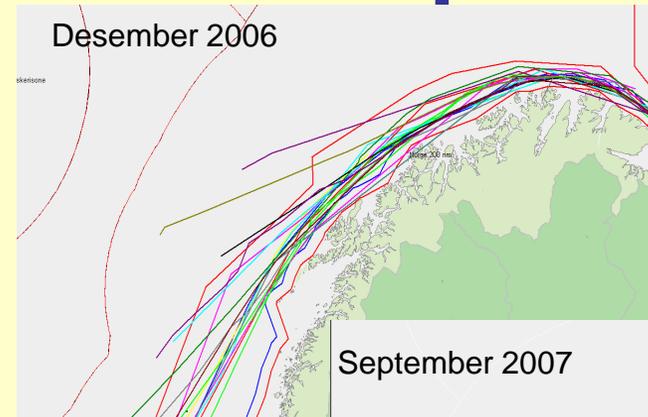

Management by areas

Protected areas

Framework for petroleum activities

Establish mandatory lanes for shipping

Other geographical regulations

Guidelines for activity

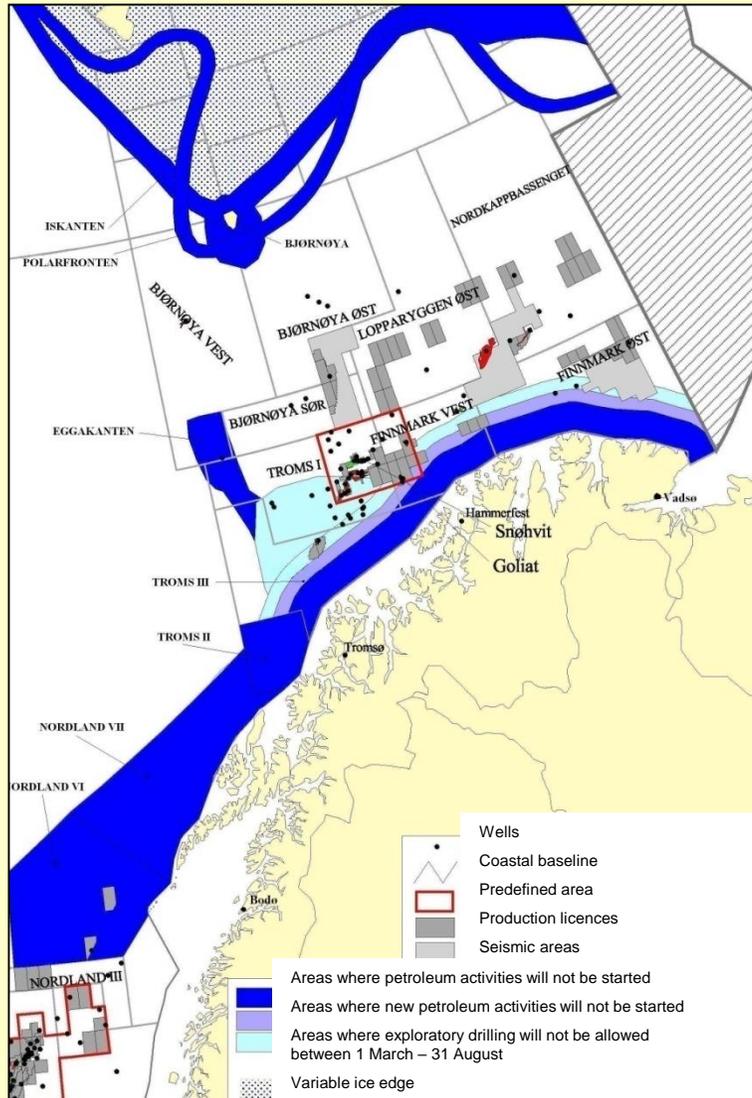

Time limitation

Volume limitation

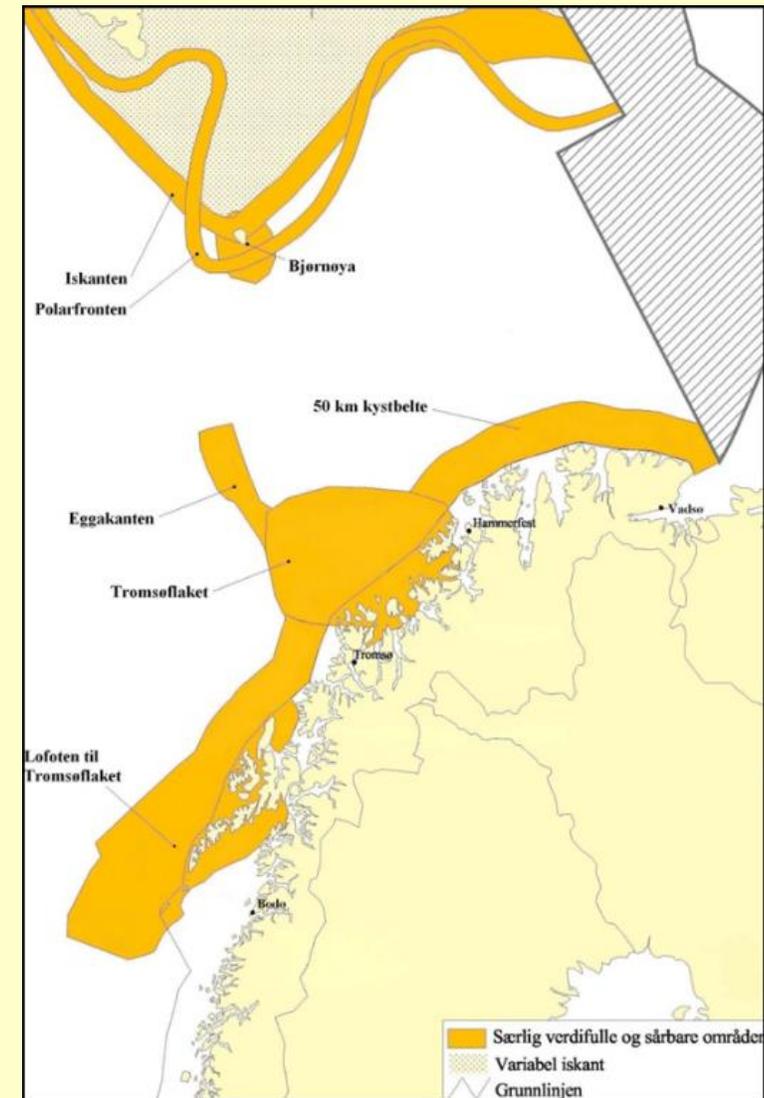

Equipment restrictions

Other demands upon technology

Area based management

Framework for petroleum activities

Valuable and vulnerable areas

Sector-based actions

- The fishery authorities' responsibility is to
 - continue to develop an **ecosystem-based management** regime for harvesting biological production
 - bring down a considerable illegal, unreported and unregulated fishing (**IUU fishing**)
 - **rebuild** certain **fish stocks** that have been severely depleted
 - **increase a general knowledge** of distribution and ecology of relevant species
 - **reduce by-catches** and **damaging of benthic communities** by fishing gears, development of selective fishing gear such as sorting grids etc.
- Maritime transport is to a large extent regulated by international laws which therefore also function as a framework for how Norway can regulate maritime transport in the Norwegian waters.

Update/revise

An Integrated Management Plan is to be updated and revised on a regular basis.

Norwegian managements plans are updated every four year and revised every 12 year.

Next update/revision for all plans: 2020.

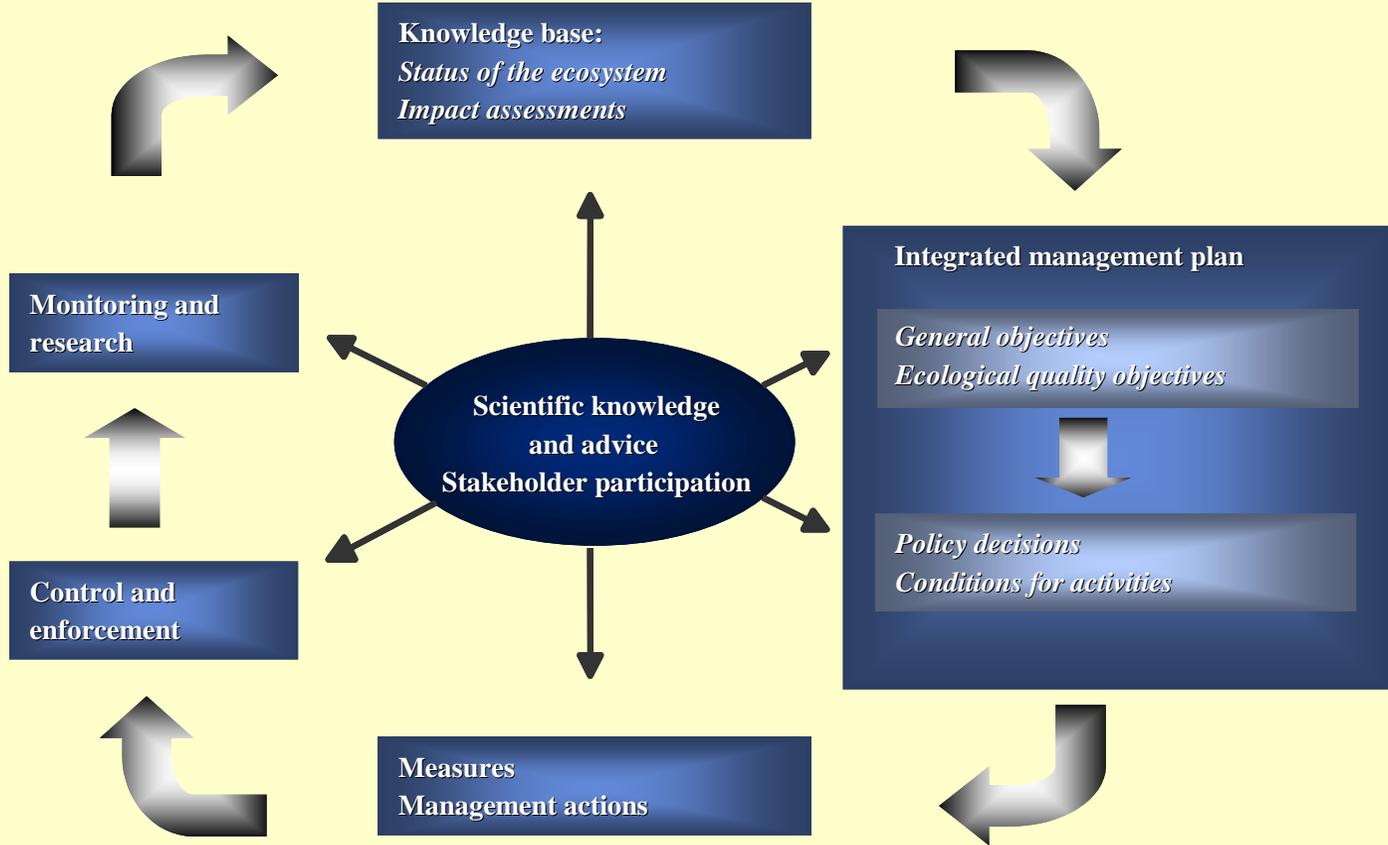

Update of the Barents Sea Management Plan

Conclusion

Before and after the management plans

From	To	Barents Sea plan
Individual species	Ecosystems	Barents Sea as ecosystem
Small scale	Multiple scales	Barents Sea – sub areas, concrete spots
Short time frame	Long time frame	Scenario 2020
Sector management	Integrated management	Combined assessment of impact of oil and gas activities, shipping and fisheries
Management and research divided	Knowledge based management	Knowledge gaps identified, monitoring needs identified, priorities set based on management needs
Sector measures	Cross sector cost-benefit analysis	Optimal risk management across sectors

Elements in an ecosystem-based approach to management

Thank you for your attention!
