The Arctic Marine Strategic Plan

The Arctic Council is a high-level intergovernmental forum to provide a means for promoting cooperation, coordination and interaction among the Arctic States, with the involvement of the Arctic Indigenous communities and other Arctic inhabitants on common Arctic issues, in particular issues of sustainable development and environmental protection in the Arctic. In 2002, the Arctic Council agreed to develop a strategic plan for protection of the Arctic marine environment. In fulfilment of this agreement, the first Arctic Marine Strategic Plan was published in 2004.

The decade since 2004 has been one of rapid climate change, increasing human activity and new emerging threats such as ocean acidification. The speed, pervasiveness and diversity of Arctic change create new challenges and opportunities for sustainable development and environmental protection. In order to address these issues, a second Arctic Marine Strategic Plan for the next decade has been developed by the Working Group for the Protection of the Arctic Marine Environment (PAME) in cooperation with Arctic Council member states, Permanent Participant Organisations, other working groups and observers.

The Arctic Council's Arctic Marine Strategic Plan 2015-2025 sets forth the rationale, frameworks, and strategic actions that will guide the work of the Arctic Council, its Working Groups, and its other subsidiary bodies.

[Note: Towards end of developing process add text describing process, motivation, and possibly main thrust of the new plan]

1. Introduction

- 2 The Arctic Council's Arctic Marine Strategic Plan (AMSP) for the 2015-2025 period provides a
- 3 strategic framework for protecting Arctic marine and coastal ecosystems and promotes sustainable
- 4 development in the region. It articulates the ways in which the Arctic Council can increase its
- 5 collective understanding of the effects and impacts of human activities in the Arctic, climate change,
- 6 ocean acidification, and support conservation and sustainable use of the Arctic marine environment.
- 7 It takes into consideration the need for forward looking cooperation with a view to increase the
- 8 capacity to adequately act upon and adapt to during this period of rapid change.
- 9 The AMSP also addresses the need to understand and shape Arctic change by recognising that
- 10 sustainability is achieved on the basis of a resilient Arctic environment and resilient Arctic
- 11 communities. The strategic actions identified in the AMSP will guide the work of the Arctic Council,
- 12 its Working Groups, and its other subsidiary bodies in the coming decade and will also contribute to
- 13 operationalizing of the Arctic Council mandate.

14 **2. Vision**

15

1

- 16 The Arctic Council's vision for the Arctic marine environment is:
- 17 Healthy, productive, and resilient Arctic marine ecosystems that support human well-being
- 18 and sustainable development for current and future generations.

19 **3. Strategic Goals**

- 20 The goals of the 2015-2025 Arctic Marine Strategic Plan are to:
- Goal 1 Improve knowledge of the Arctic marine environment, and continue to monitor
 and assess current and future impacts on Arctic marine ecosystems.
- Goal 2 Conserve and protect ecosystem function and marine biodiversity to enhance
 resilience and the provision of ecosystem services.
- 25 Goal 3 Promote value creation through safe and sustainable use of the marine
- 26 environment, taking into account cumulative environmental impacts, and
- 27 minimizing risks of negative impacts from human activities.
- Goal 4 Enhance the well-being of Arctic communities and strengthen capacity to adapt to
 changes in the marine Arctic.

30 **4. Scope**

31 This Strategic Plan covers all Arctic marine areas and relates to all key activities affecting Arctic

32 marine ecosystems; including coastal zones, river basins and other areas that are connected to the

33 marine ecosystem.

34 The AMSP addresses influences on the Arctic marine environment regardless of whether or not they

originate from within or outside the region, recognising that Arctic marine areas are connected to therest of the world through chemical, physical, biological and human interactions.

37 There is no agreed definition of the geographical extent of the Arctic. Arctic Council member states

38 will define their relevant Arctic areas which may vary depending on the context. For example, the

- Arctic can be defined by using the 10 degrees C July isotherm, by latitude (the region north of which
 one experiences at least one day 24 hour sunlight-66 33'39" N).

41 [**NOTE: include a map on the inside cover – the same as the 2004 AMSP on "Arctic Seas and

42 Coastal Areas"]

43 **5. Context**

44 5.1 A changing Arctic

Arctic marine and coastal ecosystems are places of abundant
natural resources and are widely pristine. They support diverse
services that benefit people from within and outside the Arctic and
are integral to the well-being of the people living in the Arctic.

49 Arctic climate and ecosystems are changing rapidly as a result of 50 human activities, regionally and globally. Assessments carried out 51 over the last decade under the auspices of the Arctic Council (see sidebar) have improved our current understanding of changing 52 53 arctic conditions and their impact on the environment, 54 biodiversity, oceans and human health and have documented that 55 the effects of climate change, sociocultural change, and economic 56 change in the Arctic are putting an unprecedented and increasing 57 strain on the Arctic marine environment.

58 The Arctic is also at the forefront of global climate change, 59 primarily as a result of activities occurring far from the region. The UN Intergovernmental Panel on Climate Change (IPCC) concluded 60 61 in its Fourth Assessment Report (2007) that average Arctic temperatures have increased at almost twice the global average 62 rate in the past 100 years. In its Fifth Assessment Report (2014), 63 64 the IPCC confirmed that the Arctic is continuing to experience rapid 65 climate change with reductions in sea ice and areas of permafrost, and now predicts that a nearly ice-free Arctic Ocean in September 66

Comment [A1]: Note AMAP's comment that they would like to see more detail on the effects/interactions between the changes occurring and marine ecosystems-A diagram would be good way to demonstrate but a source is needed

- is likely before the middle of this century.¹ The Arctic Biodiversity Assessment (ABA 2013) found that 67
- 68 climate change is by far the most serious threat to Arctic biodiversity and that current trends point to
- major transformative changes in ecosystems within a human life span, including loss of entire 69
- 70 habitats, such as multi-year sea ice.² Ocean acidification, primarily caused by absorption by the ocean
- of increased levels of CO₂ in the atmosphere, is occurring rapidly throughout Arctic marine waters. 71
- 72 This can result in reduced formation of shells and organism growth which again affects the food
- 73 supply for fish, birds and mammals. The economic impact of
- 74 ocean acidification could be substantial.³

91

92

Increasing industrial development and marine transportation 75 76 are other significant drivers of change in the Arctic. Growing 77 industrial development and shipping can facilitate social and 78 economic development in the Arctic through increased 79 investment in infrastructure, employment and tax revenue, 80 and can furthermore reduce the time and cost of transporting good to remote Arctic regions. However, it will bring with it 81 82 challenges such as a potential an increase in local sources of 83 contaminants. The Arctic is already a major recipient of 84 chemical pollutants, such as Mercury and Persistent Organic 85 Pollutants (POPs) carried to the Arctic through 86 transboundary, long range atmospheric and oceanic 87 transportation. The ecosystems and the people living in the 88 Arctic may be exposed to these pollutants through the food 89 chain at levels that are of concern to health authorities. Due 90 to our increased awareness and understanding of the impacts

"Three out of four indigenous people perceive climate change to be a problem in their communities and more than 50 per cent mention local contaminated sites, pollution of local lakes and streams and pollution from industrial development as problems in the region. ...despite the rapid changes in the Arctic, most indigenous peoples have maintained their traditional subsistence activities." Survey of Living Conditions in the Arctic (SLiCA) SDWG 2011

Comment [A2]: Note suggested text by SDWG moved to text box below

5 | Page

wildlife in the Arctic, global action is being taken to reduce their sources.⁴

that long range pollutants have on the health of people and

- 93 Social and cultural changes occurring in many Arctic societies are affecting the ways of life of people 94 in the Arctic, including notably, Indigenous peoples'. These changes can be expected to affect human 95 health as well as the health of the marine environment. The Indigenous peoples in the Arctic have
- 96 proven to be highly adaptable, securing their livelihood in a dynamic and challenging environment. 97 However, the rate, magnitude and diversity of current and projected changes in the region may
- 98 challenge the adaptive capacities and range of adaptive choices available to Arctic Indigenous and 99 local communities.
- 100 With this Strategic Plan the Arctic Council will aim to guide sustainable development in the Arctic and
- 101 to address the challenges and opportunities posed by a rapidly changing Arctic marine environment, 102 and increasing human use.

103 6. Principles and approaches

- 104 This Strategic Plan is consistent with the rights and
- 105 obligations covered under applicable regional and
- 106 international agreements. It is acknowledged that the UN
- 107 convention on the Law of the Sea (UNCLOS) is the
- 108 recognized legal framework for governance in the Arctic
- 109 Ocean. The Arctic Council is the most important
- 110 international forum for addressing Arctic issues. This means
- 111 that we have a predictable and relevant judicial and political
- 112 framework for international cooperation in a region
- 113 characterized by peace and stability. The AMSP is based on
- 114 widely recognized principles and approaches in
- 115 international instruments such as sustainable development,
- 116 the precautionary approach, the polluter pays principle, and
- 117 Ecosystem Based Management. The AMSP also addresses
- 118 the need to understand and shape Arctic change by
- 119 recognising that sustainability is achieved on the basis of a
- 120 resilient Arctic marine environment and resilient
- 121 communities.

122 Ecosystem Based Management

- 123 The Arctic Council strongly supports Ecosystem Based
- 124 Management (EBM), a cornerstone of the 2004 AMSP. Since
- 125 then, the Arctic Council and its Working Groups, as well as
- 126 Arctic states and observers, have made significant progress
- 127 on Ecosystem Based Management in the Arctic and
- 128 elsewhere.
- 129 Ecosystem Based Management is defined by the Arctic
- 130 Council as "the comprehensive integrated management of
- 131 *human activities based on best available scientific*
- 132 knowledge about the ecosystem and its dynamics, in order
- 133 to identify and take action on influences which are critical to
- 134 the health of ecosystems thereby achieving sustainable use
- 135 of ecosystem goods and services and maintenance of
- 136 *ecosystem integrity.*" It is the integrated management of
- 137 human activities aimed at maintaining the state of
- 138 ecosystems in good condition. EBM is increasingly
- 139 implemented worldwide in recognition that traditional
- 140 single-sector and single-resource approaches to
- 141 management are inadequate. In acknowledging this the
- 142 2012 United Nations Conference on Sustainable
- 143 Development (Rio +20) re-affirmed the significance of EBM.
- 144 The Arctic Council has identified the principles, needs, and
- 145 opportunities to operationalize ecosystem based

Principles of Arctic Ecosystem Based Management

1. EBM supports ecosystem resilience in order to maintain ecological functions and services.

2. EBM recognizes that humans and their activities are an integral part of the ecosystem as a whole, and that sustainable use and values are central to establishing management objectives.

3. EBM is place-based, with geographic areas defined by ecological criteria, and may require efforts at a range of spatial and temporal scales (short-, medium- and long-term).

4. EBM balances and integrates the conservation and sustainable use ecosystems and their components.

5. EBM aims to understand and address the cumulative impacts of multiple human activities (rather than individual sectors, species or ecosystem components).

6. EBM seeks to incorporate and reflect, to the extent it is relevant, expert knowledge including scientific, traditional and local knowledge.

7. EBM is inclusive and encourage participation at all stages by various levels of government, indigenous peoples, stakeholders (including the private sector) and other Arctic residents.

8. Transboundary perspectives and partnerships can contribute significantly to the success of EBM efforts.

9. Recognizing that ecosystems and human activities are dynamic, that the Arctic is undergoing rapid changes, and that our understanding of these systems is constantly evolving, successful EBM efforts are flexible and adaptive.

146 management in the Arctic (see sidebar).

- 147 In applying Ecosystem Based Management as an overarching approach and putting it into practice
- 148 through Strategic Actions, Arctic States will have the opportunity to further promote a common
- 149 understanding and sharing of lessons learned for Ecosystem Based Management and to demonstrate
- 150 this as a best practice internationally.

151 Precautionary Approach

- 152 The precautionary approach, as described in the 1992 Rio Declaration on Environment and
- 153 Development, is "where there are threats of serious or irreversible damage, lack of full scientific
- 154 certainty shall not be used as a reason for postponing cost-effective measures to prevent
- environmental degradation." In the 2009 Tromso Declaration the Arctic Council urged Member
- 156 States "to apply the precautionary approach and the polluter-pays principle as reflected in Principles
- 157 15 and 16 of the Rio Declaration, respectively, and conduct risk and environmental impact
- assessments for the exploration, development, transport and storage of oil, and enact and/or
- 159 enforce appropriate laws and controls." The precautionary approach is a key principle underpinning
- 160 this strategic plan.

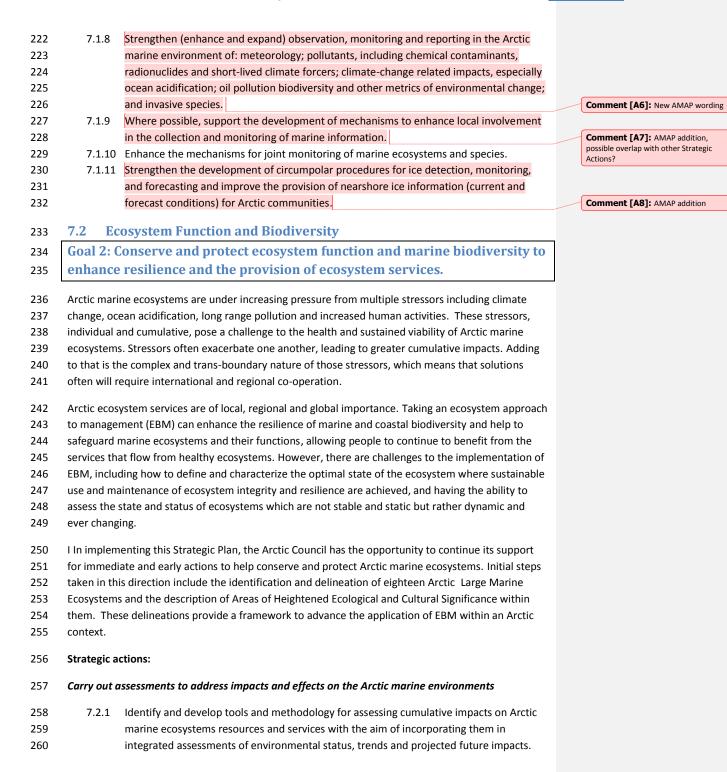

161 **7. Strategic actions**

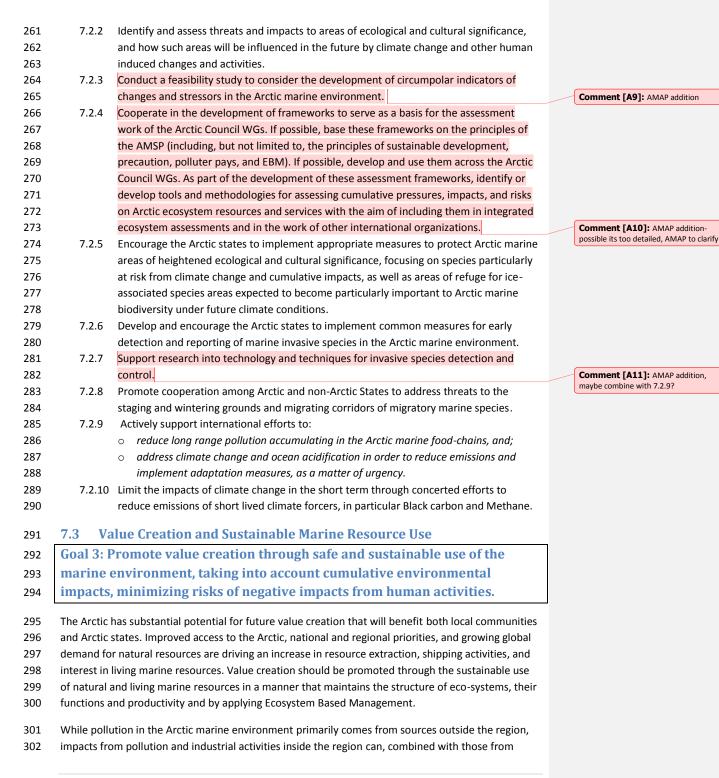

- 162 This Strategic Plan sets out a range of actions that can be undertaken by the Arctic Council through
- 163 its member states and subsidiary bodies, in collaboration with other regional and global
- 164 organizations.
- 165 The following strategic actions have been developed for each strategic goal according to the
- 166 principles and approaches outlined above, and taking into consideration the sustainable
- 167 development and environmental protection mandate of the Arctic Council. Emphasis is on actions
- 168 that are important in a circumpolar Arctic perspective. These strategic actions are also guided by the
- 169 key findings and recommendations of recently published Arctic Council reports. They focus on the
- 170 promotion of a sustainable Arctic marine environment that supports environmental, socio-cultural,
- and economic values. They also acknowledge the importance of resilient ecosystems and human
- 172 well-being for current and future generations.
- An important cross-cutting issue is the opportunity for joint action among the Arctic Council memberstates in relevant international and regional fora to promote these strategic actions.
- 175 It is anticipated that additional actions will be requires as new information becomes available 176 through, for example, ongoing or new studies by the Arctic Council working groups and others.

177	7.1 Improve and expand the knowledge-base
178	Goal 1: Improve knowledge of the Arctic marine environment, and continue
179	to monitor and assess the current and future impacts on Arctic marine
180	ecosystems.

- 181 The Arctic Council provides a framework for regional and international co-operation to improve
- 182 knowledge of the Arctic marine environment. There is increasing demand for reliable and pertinent

183 184 185 186 187 188	 faced with more development and change. Informed policy decisions depend on scientific information on the state of marine ecosystems as well as understanding the drivers of change and capacity to predict future change. Implementing effective Ecosystem Based Management (EBM) also requires knowledge about natural variability and vulnerability of ecosystems to threats and 			
189 190 191 192 193 194 195	 Monitoring Programme, CAFFs Circumpolar Biodiversity Monitoring Programmes, and the Sustained Arctic Observing Networks (SAON). Increased scientific and research cooperation with the observers in the Arctic Council will also foster improved knowledge of the Arctic marine environment. Current knowledge of Arctic marine ecosystems differ from region to region in the Arctic. A number of international research initiatives and organizations are active in the region, including under the 			
196 197 198 199 200	information associated	owledge of Arctic marine biodiversity and ecosystems is fragmentary, and while n is improving, Arctic systems are inherently complex and undergoing rapid changes with multiple stressors and their effects. These changing conditions and their potential s on human communities continue to present challenges for policy makers and governance

climate change, ocean acidification and long range pollution, produce cumulative impacts that put
 strain on these ecosystems. Mining, oil- and gas activities, shipping, Arctic settlements, legacy sites
 such as military bases and litter, are current and potential sources of marine pollution within the

306 Arctic.

307 Unique characteristics of the Arctic marine environment, which vary throughout the region, can

308 include the presence of sea ice for many months of the year, long periods of darkness, perilous

309 weather conditions, vast distances between remote communities, and a lack of infrastructure such as

accurate nautical charts and deep water ports. These factors mean that generally the Arctic will

continue to be a place of high risk for activities like marine shipping and other vessel-based activities

312 such as offshore oil and gas development and mining.

313 Overharvest was historically the primary human impact on many Arctic marine species, but sound

314 management has successfully addressed this problem in most, but not all cases. At the same time,

315 increasing demand for seafood and new harvest ventures could potentially bring new risks of

316 overharvest. This risk can be reduced through effective regulation and enforcement.

317 There is a need for cooperation on sharing of information, best practices and technologies as well as

response resources in the case of an emergency. With climate change, the possibility of extreme

319 weather events, resulting in flooding, landslides and other natural disasters is increased. Arctic states

agreements on Cooperation on Marine Oil Pollution, Preparedness and Response (2013), and Search

and Rescue (2011), have strengthened cooperation among its signatories. But challenges remain in

322 mounting an effective response effort in the instance of a major spill of oil or other toxic substances,

including radionuclides. Given the challenges of managing spills in ice infested and remote Arctic

waters, and the potential serious impacts on the Arctic marine environment, prevention of spills and

measures to minimize risks to areas of heightened ecological and cultural significance should remainthe top priority.

327 Strategic actions:

328	7.3.1	Advance EBM as an overarching framework for sustainable use of living and non-living		
329		resources in the Arctic marine environment, taking into account cumulative effects and the		
330		need for adaptation to climate change.		
331		[Initiate an assessment of the cumulative impacts of marine activities at current and		
332		projected levels based on the 18 Arctic LME boundaries]		
333	7.3.2	Improve the understanding of risks and risk reducing measures related to Arctic shipping and		
334		petroleum activities, including identify gaps and sharing of best practices related to oil spill		
335		prevention, preparedness and response to emergencies in the Arctic.		
336	7.3.3	Support the research and development of oil spill mitigation measures and response		
337		technologies in ice-covered waters.	Comment [A12]: AMA	AP addition
338	7.3.4	Develop measures, as appropriate, to prevent environmental harm and reduce risk related to		
339		maritime shipping and offshore oil- and gas activities in the Arctic, including addressing		
340		safety and environmental concerns with respect to types of vessels that may not be subject		
341		to the Polar Code.		
342	7.3.5	Continuously improve safety and environmental protection performance of offshore oil and		
343		gas operations. This could be done through a combination of regulatory controls , guidance		
344		and incentives/disincentives, and operator/regulator dialog.		

345 7.3.6 Support and enhance international efforts and cooperation to continue to identify, assess and reduce existing and emerging harmful contaminants.] Comment [A13]: AMAP addition 347 7.3.7 Fourse effective regulation and enforcement of harvesting of marine living resources that respect principles and practices for sustainable development. 383 ecosystems.

⁵ Arctic Council (2013). Arctic Resilience Interim Report 2013. Stockholm Environment Institute and Stockholm Resilience Centre, Stockholm.

384 Strategic actions:

385	7.4.1	Strengthening efforts on information and outreach to Indigenous and local communities in
386		the Arctic regarding the effects of climate change and approaches to adaptation.
387	7.4.2	Enhance education, outreach and communication to Indigenous and local communities in the
388		Arctic to strengthen their resilience and adaptation.
389	7.4.3	Improve meaningful engagement of local communities in offshore oil and gas project
390		planning, environmental assessment, operations, monitoring, regulatory decision-making,
391		and economic opportunities, including the consideration and use of Traditional and Local
392		Knowledge (TLK) to avoid or mitigate negative environmental, subsistence and cultural
393		impacts, and maintain or increase well-being and socioeconomic opportunities.
394	7.4.4	Assess vulnerabilities and adaptation options of Arctic coastal communities to changes in
395		climate and the marine environment, as well as challenges and opportunities related to these
396		changes and new patterns of activity.
397	7.4.5	Facilitate coastal community exchanges between Arctic States to improve sharing of
398		knowledge and experiences and to strengthen the dialog with relevant business and industry
399		in the Arctic in order to foster sustainable use of the Arctic marine environment.
400	7.4.6	Strengthen the Arctic Council's communication to the public in Arctic as well as non-Arctic
401		countries putting emphasis on the importance of the ongoing changes in the Arctic and their
402		likely impact also on non-Arctic areas.

403 8. Implementation

This Strategic Plan addresses both the short-term and long-term challenges and opportunities. The
implementation of specific strategic actions should be determined to a large degree by the
assessment of the risks and benefits, the collective political ability to act, the financial implications
and the capacity (knowledge, facilities and effort) available to address the required objectives at any
given time.

409 Achieving the goals of this Strategic Plan cannot be accomplished in isolation. Therefore, depending

- 410 on the nature of the strategic actions, their implementation may be undertaken through the
- 411 coordination and cooperation between the Arctic Council working groups or the governments of the
- 412 Arctic countries. Implementation can also be enhanced through the involvement of observer
- 413 countries, civil society, indigenous peoples, and the private sector.

414 Regional cooperation offers an economy of scale, particularly for research, monitoring, assessment

415 and technical cooperation. It can also enhance policy and program coordination. The implementation

416 of this Strategic Plan may require that the governments of the Arctic countries cooperate to promote

the goals of the plan in international fora relating to climate change, pollution, economic activitiesand others.

419 Arctic Council Working Group Mandates

420 Arctic Monitoring and Assessment Program (AMAP): to measure the levels and assess the effects of

- 421 anthropogenic pollutants in all compartments of the Arctic environment, including humans; to
- 422 document trends in pollution; to document sources and pathways of pollutants; to examine the
- 423 impact of pollution on Arctic flora and fauna, especially those used as food by indigenous people and

Comment [A19]: WGs to review and/or revise accordingly.

Comment [A17]: Combined AMAP/O&G contact group addition

Comment [A18]: AMAP addition

- 424 the general population; to report on the state of the Arctic environment to Ministers and relevant
- 425 fora; and, to give advice to Ministers on priority actions needed to improve the environmental
- 426 conditions in the Arctic.
- 427 Conservation of Arctic Fauna and Flora (CAFF): to address conservation of Arctic biodiversity and
- 428 communicate scientific findings to the indigenous peoples and other local residents, and to the
- 429 governments of the Arctic, helping to promote practices which ensure sustainability of the Arctic's
- 430 living resources
- 431 *Emergency, Prevention, Preparedness and Response (EPPR):* to address the prevention of,
 432 preparedness for and response to environmental emergencies in the Arctic that result from human
- 433 activities.
- 434 Protection of the Arctic Marine Environment (PAME): to address policy and non-emergency
- pollution prevention and control measures related to the protection of the Arctic marine
- 436 environment from both land- and sea-based activities.
- 437 Sustainable Development Working Group (SDWG): to address the protection and enhancement of
 438 the economies, cultures and health of the inhabitants of the Arctic, in an environmentally sustainable
 439 manner.
- 440 Arctic Council Action Plan to Eliminate Pollution of the Arctic (ACAP): to prevent adverse effects
 441 from, reduce and ultimately eliminate pollution of the Arctic environment.
- 442 Arctic Council working groups may incorporate the Strategic Actions into their biannual workplans, as
- 443 appropriate. To gauge and guide the implementation of the AMSP reports on progress of the
- 444 implementation of the AMSP will be reported regularly to the Senior Arctic Officials as part of the
- regular reporting processes of all the AC working groups. Subject to direction from SAOs and Arctic
- 446 Council Ministers, PAME, in collaboration with all Arctic Council subsidiary bodies, will also lead a
- review of the Strategic Plan by 2025, or another date specified by the Council, to determine its
- 448 adequacy in light of the results of ongoing assessments and new and emerging findings.
- 449 Under the direction of SAOs, PAME will, in consultation with other Arctic Council working groups and
- 450 permanent participants, develop a communication plan to support understanding and involvement in
- 451 the implementation of this Strategic Plan.
